

Motormouse

Instructions for re-booting (old model with Dpi switching)

1. Remove batteries from mouse.
2. Remove receiver from PC/Laptop and leave for one minute.
3. Replace batteries (correct way round) and leave trunk open.
4. Replace receiver into USB port on PC/Laptop.
5. Close trunk. Wait for red light to flash under the car and red light bar to flash on receiver.
6. Press both the left and right click buttons together until headlights flash.
Release both buttons.
7. Repeat this process three times to take the mouse through all 3 sensitivity settings.
8. Left click once.

This should re-boot the entire system and you should now be able to move your cursor on the screen.

Instructions for re-booting (New model with fixed Dpi setting)

1. Plug the Nano receiver into the USB hub again.
2. Install batteries (the right way round).
3. Press 3 buttons together (left, middle, right) for 5-10 seconds until lights stop flashing.

Then the connection will rebuild again when you left click the mouse.....
